to cover

- Overview of App Center
- Walkthrough & Demos
- Resources

-= introduction to app center =-

what is it?

a hub for mobile app lifecycle automation^(and desktop!?)

"Ship iOS, Android, Windows, and macOS apps faster and with greater confidence by automating their lifecycles." (app-center home page)

Build

Continuous integration and builds on each push

Test

Automated UI Testing on across more than 400 real device configurations

Distribute

Manual or automated distribution of builds to test groups and app stores

Crash Reports & Analytics

Automated collection of crash and session data and custom event logging

Push

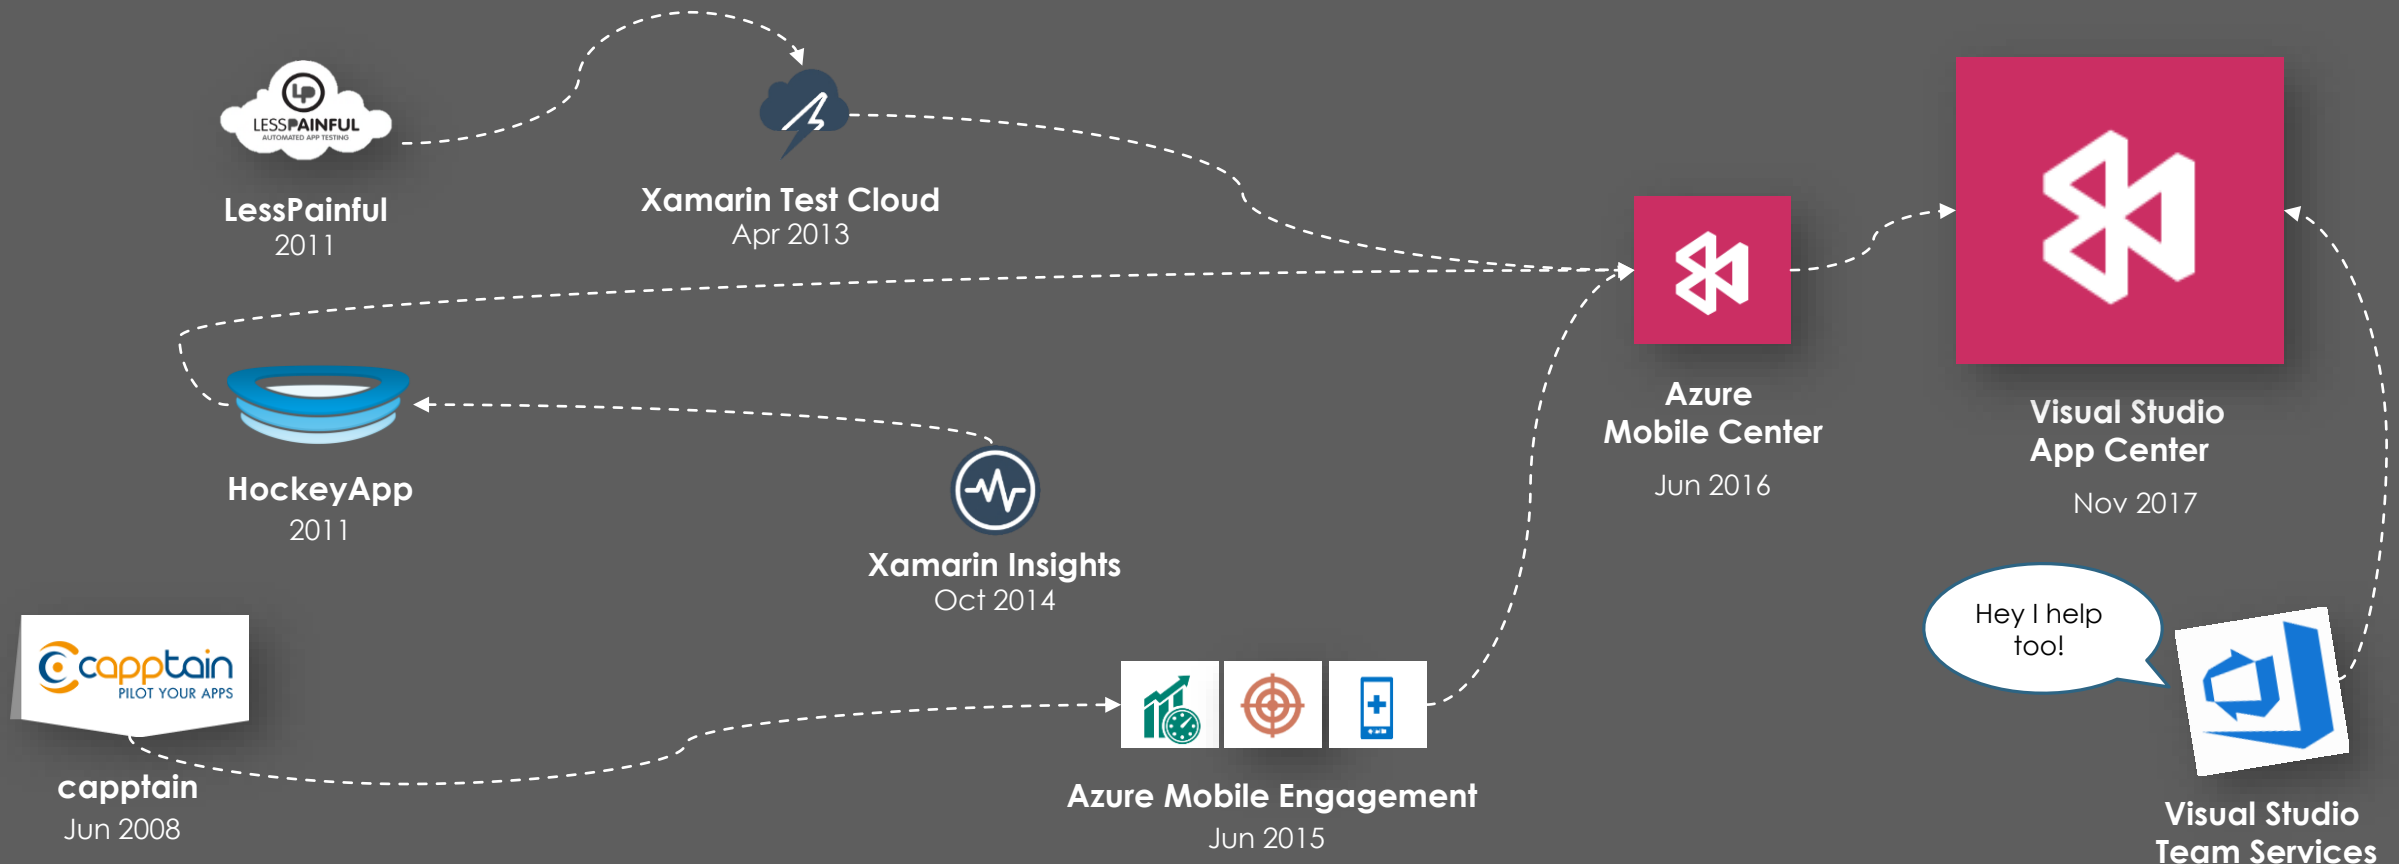

No-fuss* push campaign functionality with support for user segmentation

Released in preview as "Azure Mobile Center" in 2016, GA as "Visual Studio App Center" late 2017

meticulously merged myriad of mobile muses

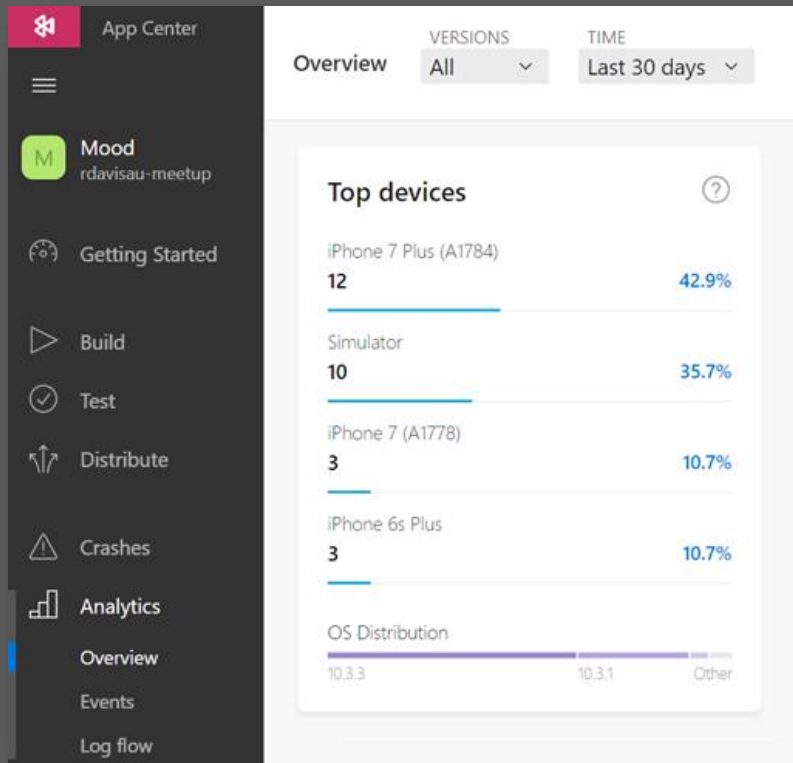

- App Center is the integration of a long history of products in the mobile analytics, test and engagement spaces.

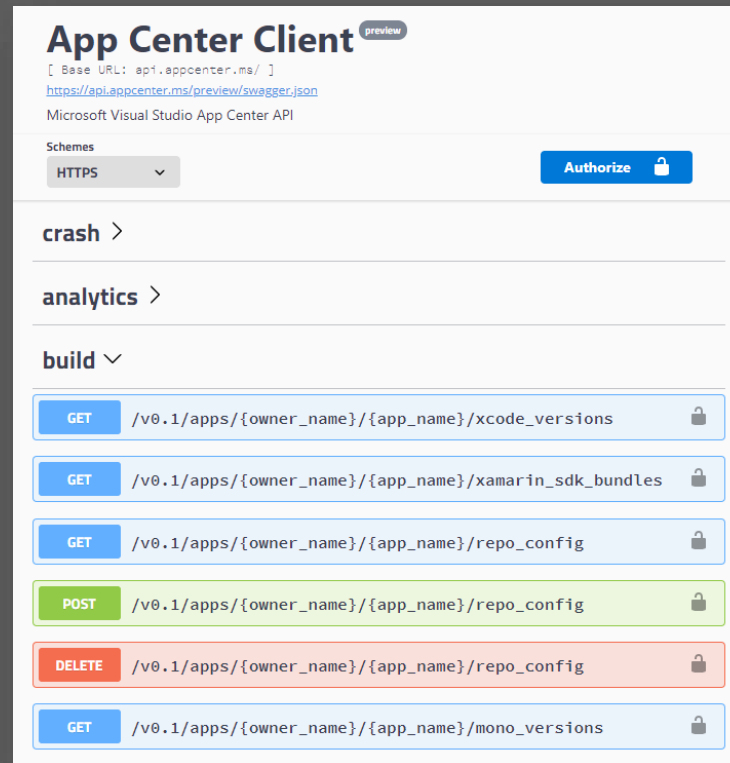

An integrated, centralised, “api-first” offering

- The portal is very user-friendly and enough for the casual user, but App Center has been designed from the outset to be integrated, automated and scripted, with many interaction points.

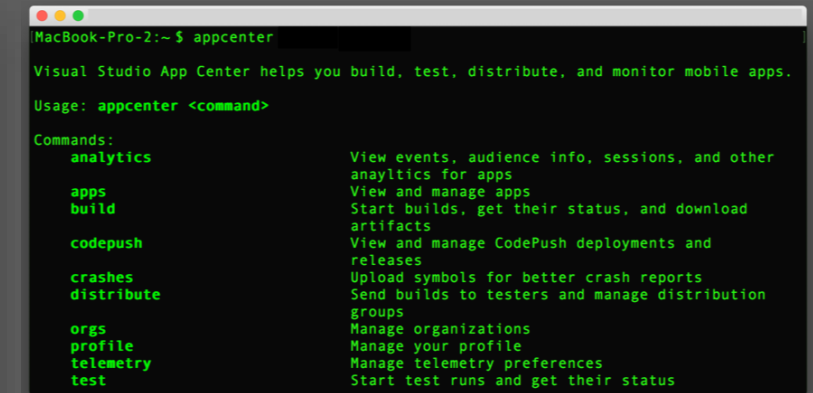

Web Portal

API

CLI

Chat Bots

Slack

Teams

not just a microsoft affair

- App Center has broad and growing coverage of platforms, source providers and frameworks.

Platforms

Android

Java, Xamarin,
React Native, Cordova

iOS

ObjC/Swift, Xamarin
React Native, Cordova

macOS

ObjC/Swift

Windows

UWP

Source Repositories

GitHub

BitBucket

VSTS

UI Test Frameworks

Xamarin UITest

Appium

XCode

Espresso

Calabash

Distribution Targets

Your beta testers

App Store

InTune Portal

a pricing model that's hard to argue with

- Almost all of the core App Center functionality is available to you for free. You can increase limits and extend functionality using a combination of paid addons.

Free Tier

Build Build Objective-C, Swift, Java, Xamarin (C#), and React Native in the cloud	✓	240 build minutes per month Up to 30-min per build
Test Automate UI tests on thousands of real devices	✓	Free 30 day trial
Distribute Send your apps to your beta testers and app stores instantly	✓	Unlimited distributions Unlimited users
Analytics Gain insights into your audience and app usage	✓	All features included
Crash reporting Monitor your app health with real-time crash reports	✓	All features included
Push notifications Engage your users by sending targeted messages	✓	Up to 5 audience segments

Paid addons

Run unlimited, faster builds
+\$40/month
per build concurrency

Test your app in the cloud
+\$99/month
per test device concurrency

Target additional segments
+\$10/month
per 100k monthly active devices

-= introduction to azure app center =-

walkthrough

introduction to mood, our demo app

- Probably going to make me a trillionaire, nice knowing you all

getting started is ez pz

- Create an **app** in the App Center portal
 - You'll create one app per OS you support (e.g. iOS, Android, UWP), even if you build your app with Xamarin Forms
 - Make sure you choose the "Xamarin" platform
- Install the **App Center SDKs** by following the instructions
 - App Center helpfully gives you platform-specific instructions
- With no additional work, you'll now get **basic analytics** (sessions/technicals) **and crash reports**. Awesome!

Add App Center's SDK to your app.

For detailed instructions on SDK integration go to: [Getting Started with the Xamarin SDK](#)

XAMARIN XAMARIN.FORMS

- 1 Add NuGet packages to your solution

Search for "App Center", and look for the following packages in the results:

 - If you are on Mac, select `App Center Analytics`, `App Center Crashes` and add both packages.
 - If you are on Windows, install `Microsoft.AppCenter.Analytics` and `Microsoft.AppCenter.Crashes` packages.

If you use the App Center SDK in a portable project, you need to install the packages in both the portable and the iOS projects.
- 2 Start the SDK

Inside your app's `AppDelegate.cs`, add the following `using` statements.

```
using Microsoft.AppCenter;  
using Microsoft.AppCenter.Analytics;  
using Microsoft.AppCenter.Crashes;
```

In the same file, add the following in the `FinishedLaunching()` method.

```
AppCenter.Start(  
    typeof(Analytics), typeof(Crashes));
```

build

- App Center connects to your app's repository so that it can build your app when you push changes.
- Once connected, you can create build definitions on a per-branch basis. These can run manually or after each push.
- App Center supports post-clone, pre-build and post-build scripts to assist in automating build activities.
 - e.g. a pre-build script to alter the app icon of a UAT build, or a post-build script to run unit or UI tests.
- Builds can be automatically released to distribution groups.
- Very easy to get going, but trades off against configurability.

Build app

Project: Mood.csproj

Configuration: Debug

Mono version: 5.4.1

Xcode version: 9.2

Build scripts: None
[Learn more about custom build scripts](#)

feat(test): improve test suite Commit: e888916a

Build 12 Automatic build

DURATION: 12 min 54 sec LAUNCH TESTED: N/A SIGNED: Yes

[Distribute](#) [Download](#)

BUILD OUTPUT

```
https://api.nuget.org/v3/index.json

Installed:
  16 package(s) to packages.config projects
##[section]Finishing: Restore Nuget
##[section]Starting: Set Bundle version
=====
Task       : Command Line
Description: Run a command line with arguments
```

Automate Your Post Build Test Runs by Following This One Awesome Blog Post In The Resources Section!

- App Center succeeds Xamarin Test Cloud in providing a real device testing capability, with more than 400 configurations.
- You define “device sets” that consist of combinations of device/OS pairs against which you can run your tests, e.g.:
 - “top devices” - the five most popular devices in your userbase
 - “small devices” - smaller screens than you normally develop on
 - “old devices” - configurations on low SDK versions.
- You invoke tests runs using the API or CLI, and can view detailed information on progress and outcomes through the portal.
- Using the post-build script feature, you can automatically run tests after each build.

DISPLAYING 198 DEVICES		OS Version

distribute

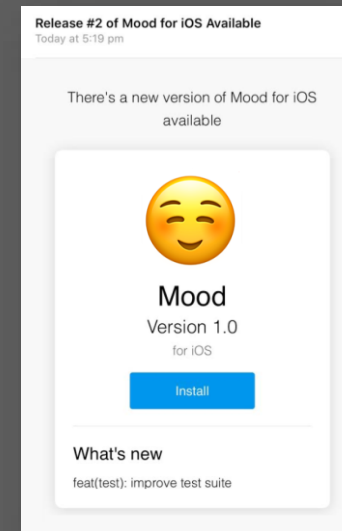

- App Center builds on the distribution feature of HockeyApp and adds a clean, user-friendly interface.
- It handles distribution group management, user invitations, UDID collection, release notifications, adoption and build hosting.

Bleeding 2 testers		RELEASE 1.1.0-dev (151928553...	DISTRIBUTED ON Feb 22, 2018
Preprod - vNext 3 testers		RELEASE 1.1.0-preprod (15192...	DISTRIBUTED ON Feb 17, 2018
UAT - vNext 8 testers		RELEASE 1.1.0-uat (1519...	DISTRIBUTED ON Feb 15, 2018
UAT - Current Store 9 testers		RELEASE 1.0.2-release-uat (150...	DISTRIBUTED ON Nov 16, 2017

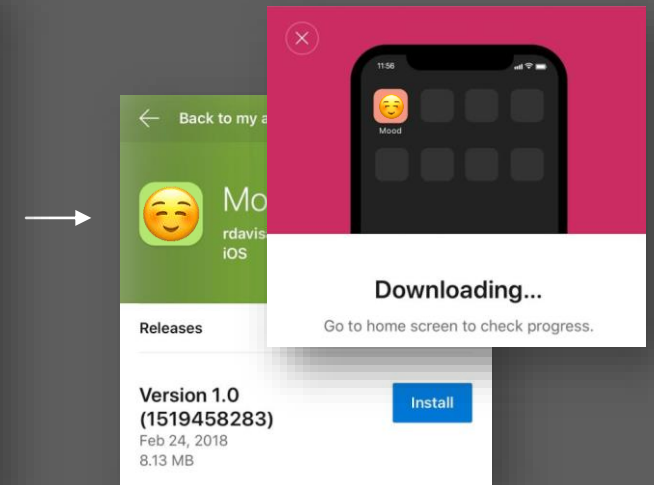

Distribution groups are set up using the portal or API

Users receive an email invitation that guides them through setup

Users receive an email notification when new releases are available

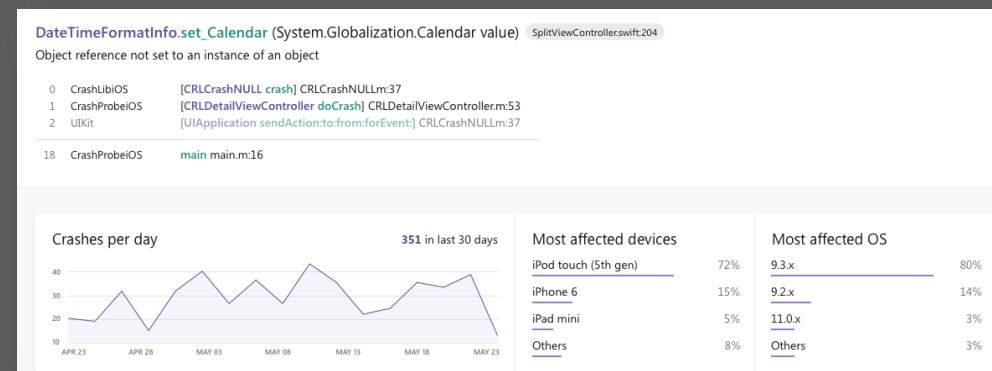

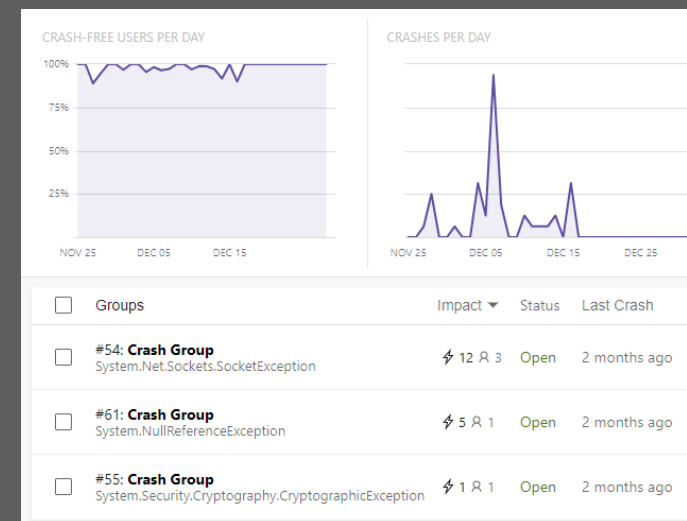

Users download the app directly onto their device

There's no way to log handled exceptions

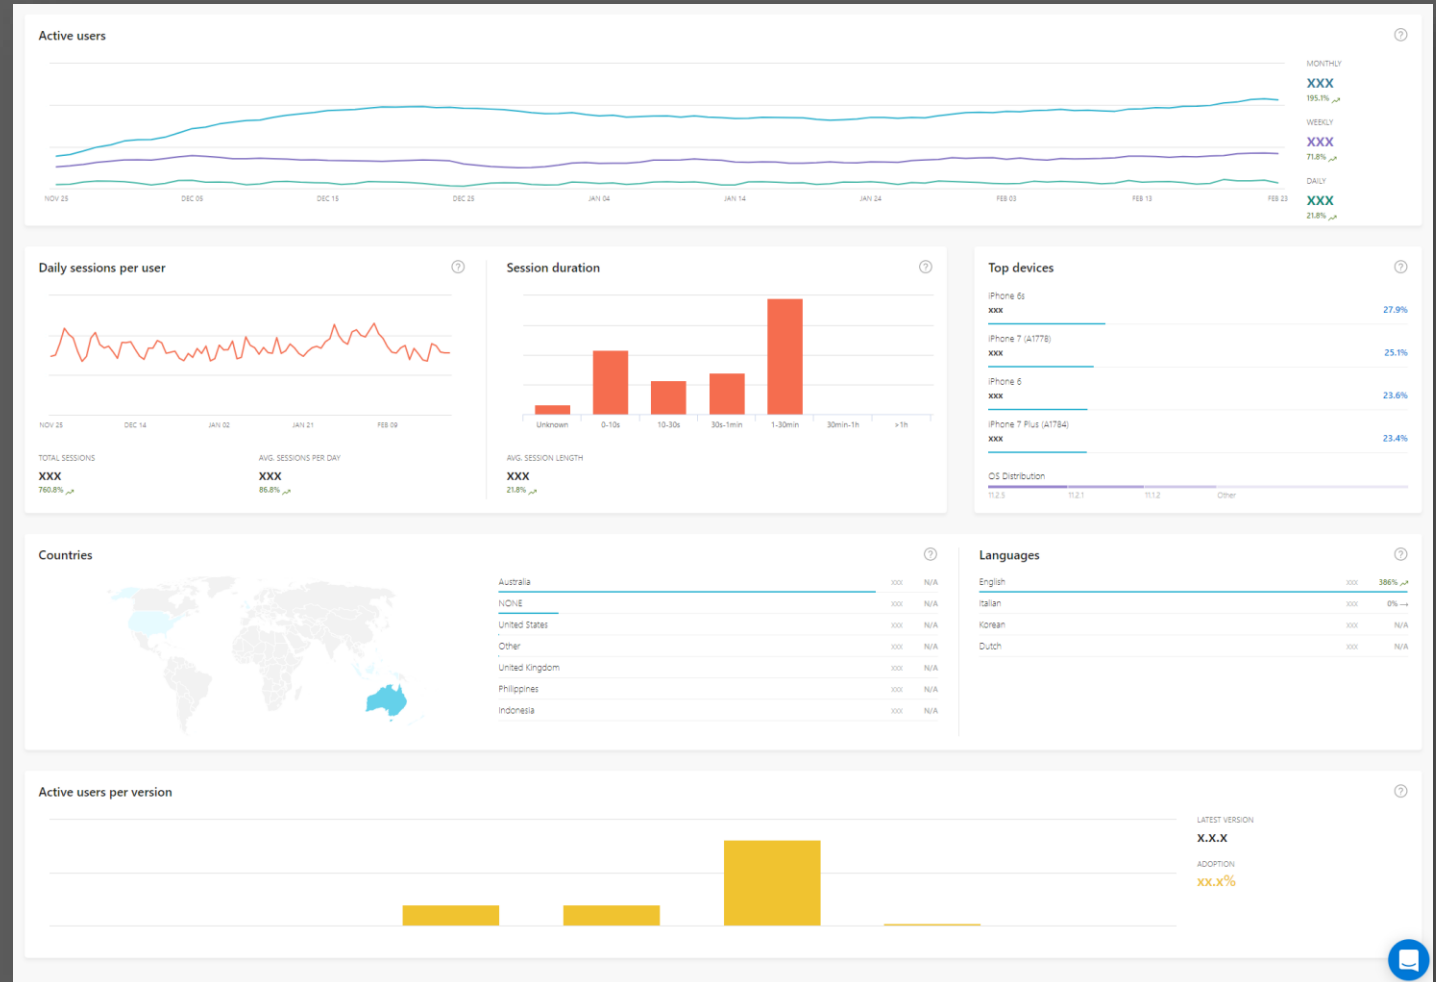

- Crash Reporting in App Center is built on the HockeyApp offering and provides comprehensive collection and grouping of application crashes.
- The Crashes SDK allows you to customise of crash reporting behaviour and add crash attachments.
- The App Center portal allows you to drill into the detail of any individual crash and view event breadcrumbs for the session and device logs.
- The report of a crash is submitted on the next launch of the app; it is possible that some crashes may go unreported.

analytics

- With the SDK installed, App Center tracks session, demographic and technicals automatically.
- Custom events can be logged by using the **Analytics.TrackEvent** method, and an event can include up to five custom properties. These properties will segment data when viewed in the portal.
- With an active Azure Subscription, all analytics data can be shipped to Application Insights and/or Blob Store for in depth analysis

push

- App Center contains a pared down version of the Azure Mobile Engagement push offering, with basic segmentation and push campaign functionality.
- Push is in preview and is likely to include more sophisticated features in the future.

Audience name:

Users not on the current version

Enter a brief description (optional)

20% You're targeting 20% of your users

App Version is not 1.2

Segment userbase into audiences using demographic or custom event data

Campaign Name:

Update Please Campaign

Used to track campaign results.

Silent push: ☐ Off

Title (optional): Time to update Mood!

Message: Mood works best when it's kept up to date. Update Mood in the App Store today!

Define a campaign and notification content

☐ All registered devices

☐ Custom device list
